

Water Service Line Material Inventory Scheduled for December 1-8, 2024

The City of Saint Paul is performing a water service line material inventory for all buildings served by the water utility. The City has contracted Kuna Engineering to assist with the survey.

Questions and Answers

What is a Water Service Line?

A water service line is the pipe that leads from the City of Saint Paul's water main to your house or business. It is installed during the process of constructing a building and is the responsibility of the building owner or homeowner.

Why is the City of Saint Paul performing the inventory?

The United States Environmental Protection Agency (EPA) Safe Water Drinking Act requires all public water systems to develop and maintain a water service line material inventory.

What will the City be looking at when they come to my house?

Monty Baker, Water/Wastewater Operator, along with Brett Kirk with Kuna Engineering,

will need access to your crawlspace or basement. They will only be observing, not making any repairs. They will photograph and document the piping, connections, and fittings. This survey will not require water to be turned off.

Which buildings will be surveyed?

The City and Kuna Engineering will be conducting in-person surveys of about 95 buildings in Old Town/Downtown. All other buildings in Up Town and New Town have already been evaluated through records and documents.

When will they survey my house?

Before the Thanksgiving holiday, Monty Baker will be visiting each of the homes to be surveyed to schedule a time that works best for you for the week of December 1-8.
